Public health concerns were the original driver of government intervention in New York City’s housing stock. Historically, creating and enforcing housing quality standards was focused on improving the health of residents in the city and controlling the spread of infectious diseases. Today, our health and our housing are still connected, especially for households living in poverty.

Housing policy is health policy. Asthma and lead poisoning are primarily caused by exposure to poor housing conditions such as mold and lead paint. High housing costs mean that families have less to spend on medical needs and healthy food. The trauma of homelessness causes lasting emotional and physical health problems. New York City’s next housing plan could address health disparities by prioritizing metrics that measure health outcomes, harnessing the power of our housing policy to help New Yorkers build a healthy life.

### WHAT IF THE GOAL OF THE NEXT HOUSING PLAN WAS TO IMPROVE THE HEALTH OF NEW YORKERS?

<table>

**POVERTY AND ASTHMA ARE DIRECTLY RELATED.**

Residents in NYCHA buildings have higher asthma rates than residents of any other housing type.

Asthma is the leading cause of ER visits in NYC causing adults to miss work and children to miss school.

**THERE ARE 60,000 PEOPLE IN NYC DHS SHELTERS ON ANY GIVEN NIGHT. 35% ARE CHILDREN.**

- Last year, 1,800 babies in NYC were born in shelter or entered shelter within their first year of life.
- Children living in private housing are over 2x as likely to be exposed to lead compared to children who live in NYCHA buildings.
